

Who We Are

SecureSky delivers a complete portfolio of cloud security solutions to help organizations protect their cloud applications, services and infrastructure. Utilizing cloud-native, third-party and SecureSky patented technologies, our solutions meet the security, compliance and budget requirements of today's dynamic enterprises.

SecureSky solutions include Security Consulting, focused on identifying risk and deploying protective controls and policies and Managed Detection and Response (MDR), providing active threat detection and threat hunting, expert response and continuous protective control optimization.

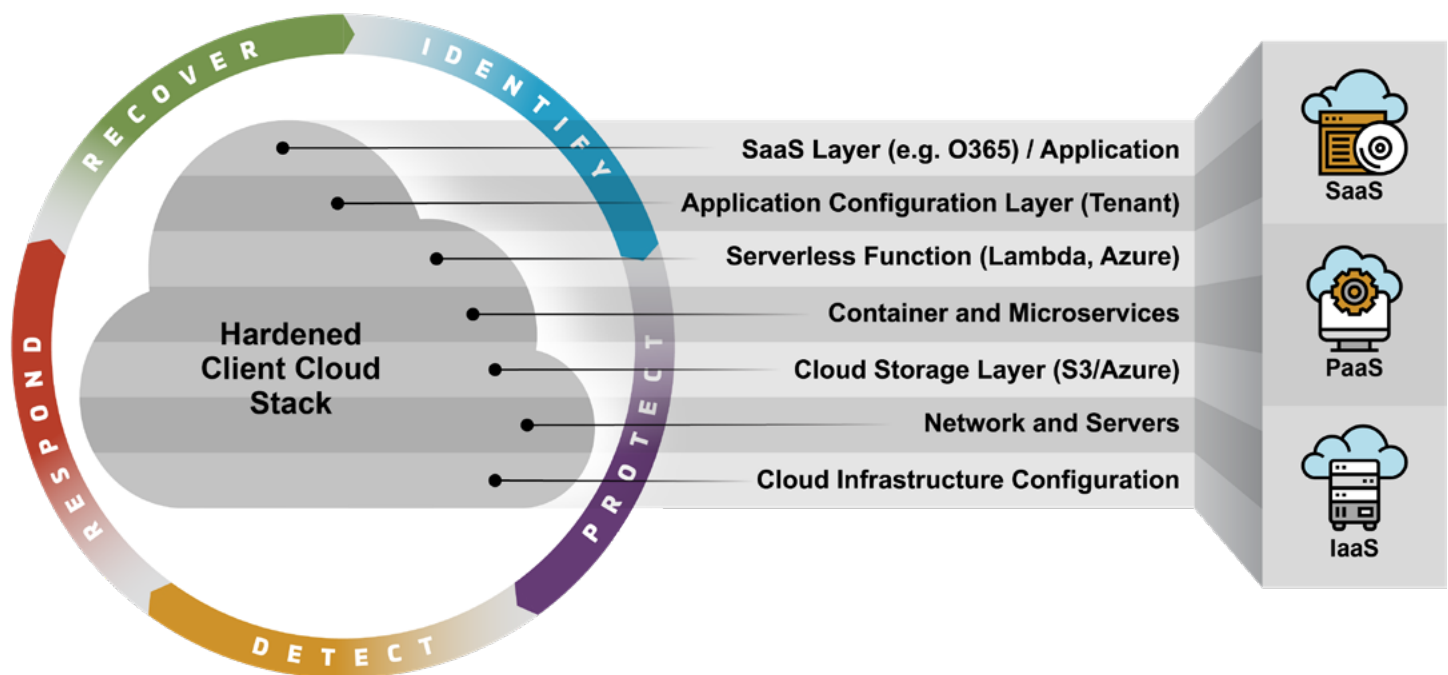

Our services are supported by our Cloud Risk and Threat Protection technology and the patented Active Protection Platform.

SecureSky MDR Services - Threat Detection, Hunting and Response

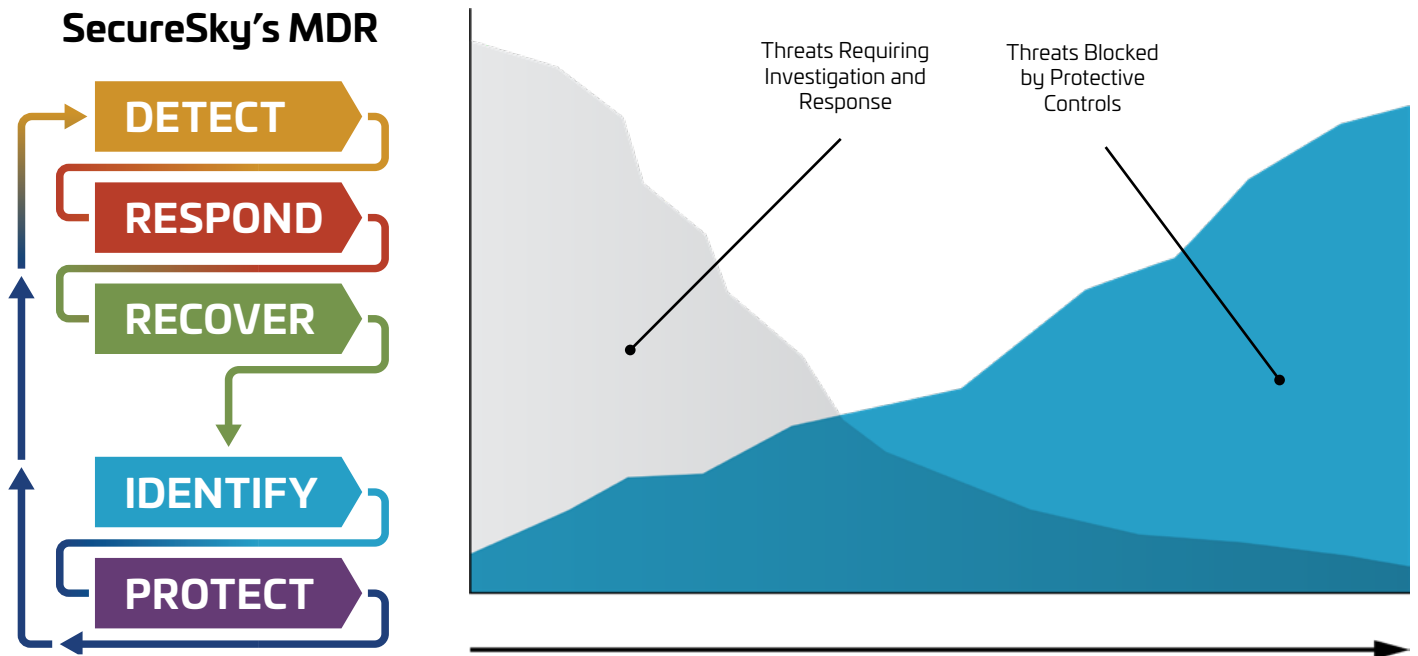

The SecureSky's MDR team will work closely with you to:

- Deploy validation technology to test existing protective controls and detection policies
- Implement native and advanced alerting from your environments
- Guide the deployment of cloud-native tools for centralized log collection, detection, analytics and investigation
- Develop scenario-based threat hunting playbooks and schedules
- Determine use cases and threat intelligence sources for free-form threat hunting
- Define response actions and escalation procedures
- Plan recovery optimization processes, as threats are found, to strengthen the environment and prevent recurrence.

Protection and Detection Capabilities Across All Layers of Your Cloud Stack

Continuous Optimization of Protection and Detection

Organizations today constantly find themselves reacting to threats, and, with a growing cybersecurity skills shortage, challenged to find resources capable of advanced detection, investigation and response. SecureSky's Managed Detection and Response focus is to evaluate lessons learned from detection and response activities, and deploy protective measures to stop that threat from recurring.

SecureSky will also analyze alerts to reduce false positives and "noise," further reducing alert volumes. Over time, as protective controls and detection policies are strengthened and unneeded "noise" is tuned out, threat volumes will decrease, allowing detection and response resources to focus on true threats to the environment.

"SecureSky's MDR services helped improve our defensive layer and allowed their experts to focus on the right threats and continuous improvements."

- CISO, SecureSky client
